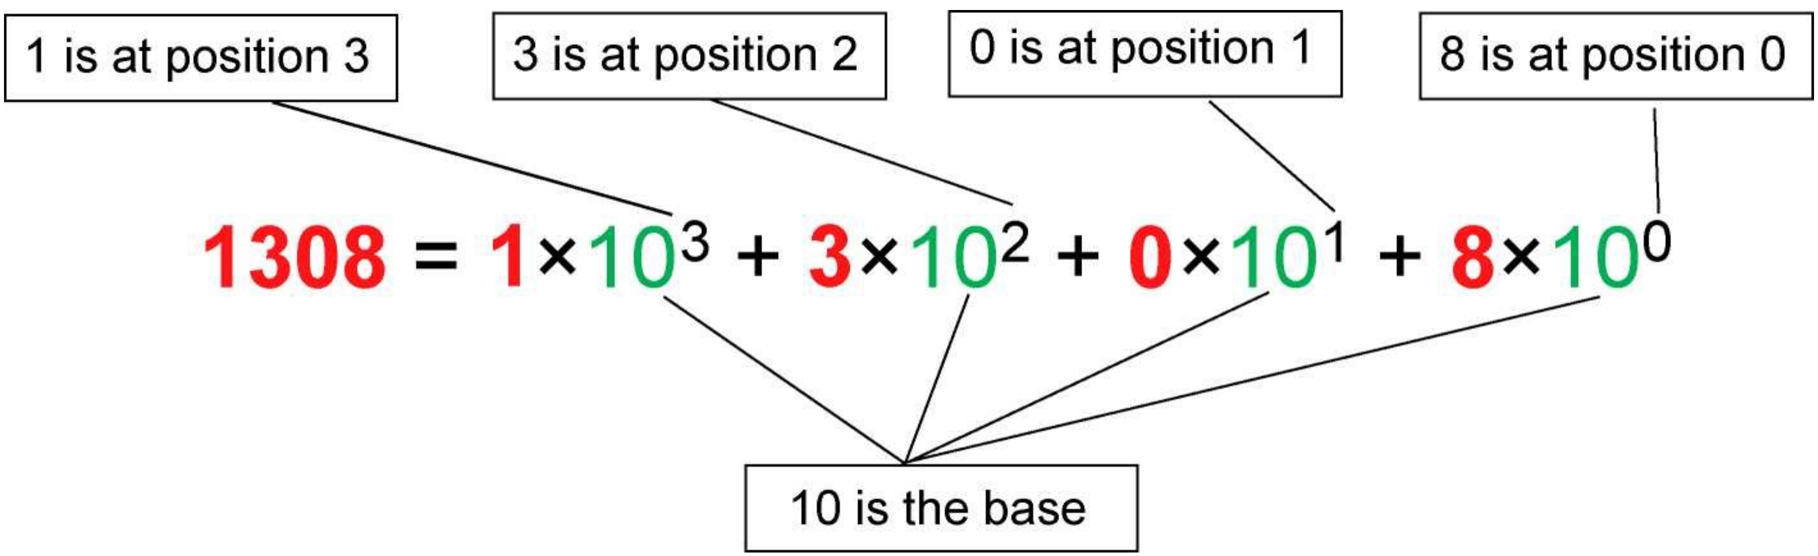
Number Systems I

Number Representation

- Decimal Notation: 10 digits (0-9)
- Binary Notation: 2 digits (0,1)
- 10 is the base for Decimal, 2 is the base for binary notation



Number Representation

- Decimal Notation: 10 digits (0-9)
- Binary Notation: 2 digits (0,1)
- 10 is the base for Decimal, 2 is the base for binary notation

1 is at position 3

0 is at position 2

1 is at position 1

0 is at position 0

$$1010 = 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0$$

2 is the base

Number Representation

- Representation of n base b is called the base b expansion of n

For an integer $b > 1$. Every positive integer n can be expressed uniquely as:

$$n = a_k \cdot b^k + a_{k-1} \cdot b^{k-1} + \cdots a_1 \cdot b^1 + a_0 \cdot b^0,$$

where k is a non-negative integer, each a_i is an integer in the range from 0 to $b - 1$, and $a_k \neq 0$.

$$1308 = 1 \times 10^3 + 3 \times 10^2 + 0 \times 10^1 + 8 \times 10^0$$

Converting from base b to decimal

For an integer b > 1. Every positive integer n can be expressed uniquely as:

$$n = a_k \cdot b^k + a_{k-1} \cdot b^{k-1} + \cdots a_1 \cdot b^1 + a_0 \cdot b^0,$$

where k is a non-negative integer, each a_i is an integer in the range from 0 to b - 1, and $a_k \neq 0$.

$$(2012)_3 = 2 \times 3^3 + 0 \times 3^2 + 1 \times 3^1 + 2 \times 3^0$$

$$= 2 \times 27 + 0 \times 9 + 1 \times 3 + 2 \times 1$$

$$= 59$$

Hexadecimal Numbers

- 16 digits
- 0, 1,2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

Hex	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Decimal	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Binary	0000	0001	0010	0011	0100	0101	0110	0111	1000	1001	1010	1011	1100	1101	1110	1111

- A 4-bit binary number can be represented with 1 Hexadecimal Digit
- 1 byte is equivalent to 8 bits
- So, 1 byte can be represented by 2 Hexadecimal digits

Hexadecimal Numbers

- 16 digits
- 0, 1,2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

Hex	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Decimal	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Binary	0000	0001	0010	0011	0100	0101	0110	0111	1000	1001	1010	1011	1100	1101	1110	1111

$$(3B2)_{16} = 3 \text{ x} 16^2 + B\text{x}l6^1 + 2 \text{ x} 16^0$$

$$= 3\text{x}256 + 11\text{x}16 + 2 \text{ x } 1$$

$$= 946$$

Converting from decimal to base b

For an integer b > 1. Every positive integer n can be expressed uniquely as:

$$n = a_k \cdot b^k + a_{k-1} \cdot b^{k-1} + \cdots a_1 \cdot b^1 + a_0 \cdot b^0,$$

where k is a non-negative integer, each a_i is an integer in the range from 0 to b - 1, and $a_k \neq 0$.

$$\Big[\text{Base b expansion of (n div b)}\Big]\Big[\text{n mod b}\Big]$$

Converting from decimal to base b

Given n = 1161

$1161 = (3246)_7$

Find base 7 digits:

$3 \cdot 7^3 + 2 \cdot 7^2 + 4 \cdot 7 + 6 = 1161$

Digit in the range
0, 1, 6...,

$\overbrace{3 \cdot 7^3 + 2 \cdot 7^2 + 4 \cdot 7}^{\text{Multiple of 7}} + 6 = 1161$

For remaining digits use
1161 div 7 = 165

$3 \cdot 7^2 + 2 \cdot 7 + 4 \qquad 6$

Rightmost digit is
1161 mod 7 = 6

$3 \cdot 7 + 2 \qquad 4$

Next digit is
165 mod 7=4

For remaining digits use
165 div 7= 23 ✓

$3 \qquad 2$

Next digit is
23 mod 7=2

For remaining digits use
23 div 7=3

Since 3 is in the range 0, 1,..,.6 $\longrightarrow$ All Done!

$1161 = (3\,2\,4\,6)_7$

Example

Convert the following decimal numbers to a base 2 number:

31

32

255

127
